

ABSTRACT OF THE DISCLOSURE

The lending reservation system comprises client terminals and a digital camera server terminal connected to LAN. A digital camera can be connected to or disconnected from the server terminal. A user inputs information required to reserve the digital camera into any one of the client terminals. The client terminal transmits this information to the server terminal through LAN. The server terminal decides whether a reservation can be made. If the reservation can be made, the server terminal registers the reservation and informs the client terminal that the reservation is made.
